Attention isn't opportunity: we turn India signals into evidence-backed IP decisions

PROBLEM

Signals about Japanese IP in India are scattered across search, video, wiki and retail. Spikes look like demand but often fade; licensors lack a disciplined way to decide what to investigate.

USER & DECISION

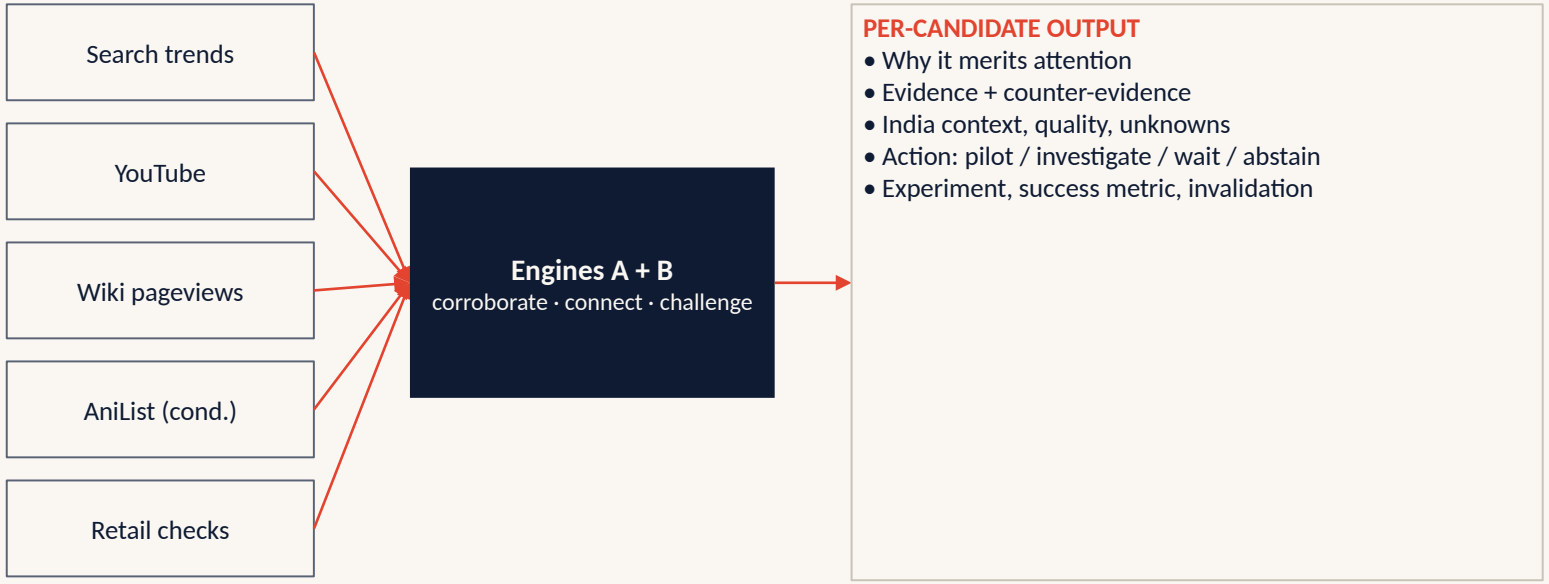

A licensing, distribution or merchandise lead at a Japanese studio or licensor, or their India partner, deciding which IPs deserve investigation, why, and what to test next.

TWO ENGINES

A · India Trend Radar
Search momentum, persistence, emerging topics, engagement, regional/language signals from permitted public sources

B · IP Opportunity Engine
Comparable IP, formats, audiences, localization, availability & pricing, competition, uncertainty, experiments

FROM SCATTERED SIGNALS TO A DECISION

WORKFLOW

DISCOVER → CORROBORATE → CONNECT → ASSESS → CHALLENGE → TEST → MEASURE → IMPROVE

Not another trend dashboard: every recommendation shows its evidence, its counter-evidence, and the next experiment to run.

Brief: GEEK-PS-01, Predicting Indian Market Potential for Japanese Media Content Using Big Data. All capabilities shown are proposed.

Demand tools exist; what's missing is an evidence-to-decision workflow for Japanese IP in India

WHY IT MATTERS

JETRO (2026): imports of Japanese IP goods into India are currently very small, partly because import procedures (BIS certification for some products, IEC, GST) are complex and information is scarce.

Implication: a candidate needs commercial-path evidence, not just attention.

DEMAND SIGNALS, NOT REVENUE

Hakuhodo India (Jul 2026, n=1,200, 8 cities): 61.1% prefer dubbed anime; 73.1% of them choose Hindi. Crunchyroll data via Variety (Mar 2026): India watch time up 3.5x in a year.

Google Trends is relative (0–100), not volume: one signal to corroborate.

	Measures attention	Counter-evidence	Abstain option	Next experiment	India IP focus
Google Trends	Relative (0–100)	–	–	–	–
Parrot Demand360	Cross-platform demand	–	–	–	–
Meltwater social listening	Social mentions	–	–	–	–
Manual research	Ad hoc	Ad hoc	Ad hoc	Ad hoc	Possible
Our proposal	**Corroborated signals**	**Built in**	**Built in**	**Built in**	**Core**

Comparison is about workflow scope, based on public product descriptions; we do not claim to be first to use AI for entertainment analytics.

ILLUSTRATIVE EXAMPLE — HYPOTHETICAL IPs, NOT REAL DATA

Candidate A
Viral spike, short half-life
→ **INVESTIGATE or WAIT**

Candidate B
Persistent attention + corroborating retail & localization evidence
→ **PILOT**

Candidate C
Looks promising, but evidence is thin
→ **ABSTAIN / collect data**

The value is not a higher score — it is knowing when to pilot, when to wait, and when the evidence is too weak to act.

Groups A–D build the evidence base: data, IP graph, signal AI and India context

Highlighted (vermilion outline) = proposed MVP subset. Everything else is target-state.

A · DATA & EVIDENCE	B · IP REGISTRY & GRAPH	C · MULTIMODAL AI	D · INDIA MARKET
1 Universal ingestion · MVP Connectors for permitted sources	**11 Canonical IP registry** · MVP One ID per franchise	**21 Multimodal feature fusion** Combine signal types	**31 Opportunity atlas** · MVP Candidates by region
2 Scheduled refresh · MVP Timed, logged pulls	**12 Ownership/rights graph** Who holds which rights	**22 Temporal encoder** Patterns over time	**32 Regional sample-size controls** · MVP Flag thin regional data
3 Schema normalization · MVP One shared data model	**13 Adaptation graph** Manga → anime → film links	**23 Multilingual text encoder** Indian languages + English	**33 Localization readiness** · MVP Dubs, subs, translations
4 Entity resolution · MVP Match titles across sources	**14 Product taxonomy** Shared product categories	**24 Permitted image/video metadata** Metadata only, as permitted	**34 Retail/availability monitor** Permitted listing checks
5 Provenance ledger Source & time per datum	**15 Franchise embeddings** · MVP Similarity vectors	**25 Sentiment/emotion** Tone of public comments	**35 Import/affordability analysis** Duties, price points
6 Quality checks Validity and range tests	**16 Comparable-IP retrieval** Find analog franchises	**26 Purchase-intent extraction** "Where to buy" signals	**36 Release calendar** Upcoming India releases
7 Missingness handling · MVP Missing ≠ zero	**17 Competitor/substitute graph** Rival titles & products	**27 Cultural-resonance analysis** Fit with local themes	**37 Offline-to-online evidence bridge** Events, stores ↔ online
8 Historical snapshots Reproducible past views	**18 Lifecycle tracker** Release & season phases	**28 Cross-modal consistency** Do signals agree?	**38 Regional gaps** Interest without supply
9 Independent-source corroboration Agreement across sources	**19 Cross-category aftershock** Spillover between categories	**29 Weak-signal discovery** Early, small trends	**39 Awareness-to-purchase funnel** Stage-wise evidence
10 Source reliability Per-source trust weight	**20 Franchise digital twin** Unified franchise state	**30 Anomaly/manipulation detection** Flag bots and spikes	**40 Local competitive landscape** Rival IP in India

All 80 capabilities are proposed modules of one platform, not implemented features. Highlighted = MVP subset (A1–A4, A7, B1, B5, D1–D3 = items 1–4, 7, 11, 15, 31–33).

Groups E–H turn evidence into calibrated forecasts, commercial tests and auditable decisions

These are 40 capabilities in the proposed long-term platform, not 40 separate AI models.

E · Forecasting, Calibration & Model Reliability	F · Commercial & Strategy Intelligence	G · Autonomous Research & Continuous Operations	H · Explainability, UX & Governance
41 Category-Specific Forecasting	51 Hype-versus-Money Engine · MVP	61 Opportunity Discovery Agent	71 Executive Opportunity Dashboard
42 Adaptive Model Router	52 Price Elasticity Estimator	62 Active Learning	72 Why This Prediction? · MVP
43 Forecast Ensemble	53 Revenue Bridge	63 Evidence-Grounded Research Reports · MVP	73 Interactive India Market Map
44 Prediction Intervals and Quantiles	54 Supply-Constrained Demand Detection	64 Continuous Watchtower	74 Franchise Explorer
45 Probability Calibration	55 Product-Gap Discovery · MVP	65 Source Drift Monitor	75 Scenario Comparison Workspace · MVP
46 Temporal Backtesting · MVP	56 Launch Strategy Simulator	66 Model Version Registry	76 Evidence Audit View · MVP
47 Forecast Disagreement Detector	57 Pilot-Launch Optimizer · MVP	67 Forecast Change Log	77 Business Report Export
48 Distribution-Shift Detection	58 Causal Impact Evaluation	68 Counterfactual Challenge Mode · MVP	78 Role-Based Workspaces
49 Confidence and Abstention Engine · MVP	59 Portfolio Optimizer	69 Human Review Queue	79 Alerts and Watchlists
50 Forecast Autopsy	60 Licensing Opportunity Research	70 Rights, Privacy and Compliance Controls	80 Feedback and Decision Outcome Tracking

Proposed modules only; none are implemented. Highlighted = MVP subset (46, 49, 51, 55, 57, 63, 68, 72, 75, 76).

A validated pipeline that ranks, forecasts only defined targets, and can abstain

PERMITTED EVIDENCE SOURCES → NORMALIZATION AND PROVENANCE → IP KNOWLEDGE GRAPH AND TIME-ALIGNED FEATURES → TEMPORAL AND MARKET ANALYSIS → TRANSPARENT SCORING OR A DEFINED FORECAST → EVIDENCE, COUNTER-EVIDENCE AND UNCERTAINTY → RECOMMENDED BUSINESS EXPERIMENT

DATA REPRESENTATION

$$X \in \mathbb{R}^{(I \times T \times R \times C \times F)}$$

I = IPs, T = time, R = regions, C = categories, F = features
Observation mask M: missing ≠ zero · Quality metadata Q
Typed IP graph: adaptation-of, licensed-to, sold-by, competes-with — kept distinct
$S_i = 100 \times \Sigma_k w_k z_{ik}$ **— a relative ranking, not a probability or revenue**

THREE OUTPUTS, KEPT SEPARATE

1. Opportunity assessment (relative, evidence-backed)
2. Forecast — only where a defined target exists
3. Action — pilot, investigate, wait, or abstain

VALIDATION

TARGET DEFINITION → NAIVE BASELINE → CHRONOLOGICAL HOLDOUT → MODEL COMPARISON → ABLATION AND ROBUSTNESS → EVIDENCE AUDIT

MVP (PROPOSED)

Python, pandas/DuckDB, rolling features, regularized regression / gradient-boosted-tree baseline, Streamlit UI

TARGET STATE (PROPOSED)

Adds sequence models, a GNN and multimodal fusion — only if they beat baselines on future data

Index S_i is a relative ranking, not a probability or revenue. Advanced models are proposed and adopted only if they beat baselines on future (held-out) data.

In seven days we can ship a transparent MVP with tests, a claim audit and a rehearsed demo

DAY 1	DAY 2	DAY 3	DAY 4	DAY 5	DAY 6	DAY 7
Lock decision, source permissions, schema, interfaces	IP registry, provenance ledger, initial dataset (30–50 candidates, stretch)	Temporal features, transparent scoring, baseline	UI, evidence retrieval, comparison, uncertainty	Tests, claim audit, sensitivity, baselines	Integrate, fix, deck and demo	Freeze, clean-run tests, rehearse, fallback

PARALLEL LANES

RISKS & MITIGATIONS

API terms / coverage
→ Permitted sources only; conditional source list

Sparse India data
→ Regional sample-size controls and abstention

Hype vs demand
→ Trend half-life and independent corroboration

No outcome labels
→ No revenue claims; define the data needed

The goal is not to predict success from hype. It is to turn fragmented market evidence into transparent, testable, and progressively better IP decisions.

Plan is proposed; the 30–50 candidate dataset is a stretch target. Data use limited to permitted sources; AniList conditional on its terms for commercial use; YouTube Data API subject to its developer policies.
